### Can We Decide Which Outcomes Should Be Measured in Every Clinical Trial? A Scoping Review of the Existing Conceptual Frameworks and Processes to Develop Core Outcome Sets

Idzerda L, Rader T, Tugwell P, Boers M. Can we decide which outcomes should be measured in every clinical trial? A scoping review of the existing conceptual frameworks and processes to develop core outcome sets. *J Rheumatol* 2014;41:986-93; published online before print: doi:10.3899/jrheum.131308

In the scoping review of processes used to develop core sets<sup>1</sup>, the summary of the work done in eczema (Table 3) was incomplete, listing only the initial systematic review. Briefly, the Harmonising Outcome Measures for Eczema (HOME) initiative<sup>2</sup> is an international multiprofessional group that aims to standardize and validate a core set of outcome measurement instruments for atopic eczema. Following a systematic review<sup>3</sup> on the domains and instruments to measure aspects of severity of eczema, a multiperspective consensus panel was established consisting of patient representatives, clinicians, journal editors, and regulators to define a core set of outcome domains for eczema trials and for record keeping in routine care<sup>4</sup>. Delphi methods and nominal group technique have been used in the development process<sup>5</sup>. HOME has been linked with Outcome Measures in Rheumatology Clinical Trials (OMERACT) from the beginning, and is applying the OMERACT filter<sup>6</sup> as a criterion to recommend outcome measurement instruments<sup>7</sup>.

We regret the omission.
